📍 Marseille, France
Remote across Europe

Senior Product Designer for complex SaaS & B2B.

8+ years turning friction-heavy, data-dense products into intuitive, high-performing, ethical journeys, with measurable business impact.

I combine **AI-augmented workflows**, **design systems at scale**, and research practices that make whole teams faster, not just individual screens better.

Based in Marseille, available remotely across Europe.

PROJECT INDEX

What's in this portfolio

Deep dives in this portfolio

- **CoderPad** - AI-native hiring tools, current role
- **Dualsun** - Solar B2B simulator & IoT dashboard

Additional work - selected highlights

- **Airbus / Alten** (aerospace, 50,000+ staff) - Research-led redesign of a production-monitoring dashboard → +20% retention & adoption
- **Wisecure** - Core-journey redesign for a geolocated-security product
- **HipeKids** - Registration journey redesign → +8% sign-ups
- **Orange** - Voice-as-a-Service simplification & DataShare IoT portal → 1st place, Orange innovation competition; 2nd place, APIdays 2020

WHAT I BRING TO A SENIOR TEAM

Three ways I create leverage

01

AI-native product design

I design AI features people trust, and the AI-ops that ship them fast.

AI scoring & autonomy

Video summary

Recruiter chatbot

02

Design systems at scale

I turn dense, technical SaaS & B2B products into clear, consistent journeys.

Design system + AI ops

WCAG systems

Reusable components

03

Research that drives decisions

I run research that changes what teams build, not just how screens look.

User interviews

Usability testing

A/B & MAB testing

How I lead and enable teams

01 · Enable & upskill

I make research and design a team sport, not a bottleneck on one person. **-50% research time**

02 · Set the standard

I raise the quality bar and make it repeatable across the team. **Guides adopted team-wide**

03 · Unblock delivery

I turn design from a blocker into an accelerator for the roadmap. **+20% PM discovery**

One of the internal reference guides I author and maintain - this one on accessibility - so best practices scale across the team, not just through me.

CoderPad

AI-native hiring tools that cut recruiter overload

The challenge

Recruiters were drowning in async technical tests: long candidate videos to watch, scattered results to compare, slow and subjective decisions. My job: design AI-native tools that make hiring decisions faster and more confident.

MY ROLE

AI feature design (0 → 1)
Scoring & autonomy UX
Video summary & transcription
Collaborative candidate profiles

TEAM

3 designers
Product managers
Engineering & QA

TOOLS

Figma · Custom GPTs & agents
MCP · Claude Code
Design tokens

Results

60+

companies adopted the feature in 3 months

10,000+

test cases processed

+65%

month-over-month usage growth

95%

of users agree with AI decisions

CODERPAD

How I did it

PAIN POINT

Recruiters spent hours watching candidate videos and comparing scattered async results, slowly and subjectively.

THE REAL CHALLENGE

Make AI trustworthy for high-stakes hiring - help recruiters decide faster without feeling the AI decides for them.

OUTCOME

Faster, more confident, more collaborative hiring decisions on async tests.

01 · FRAME - Design AI review surfaces

I designed follow-up questions (video, screen-recording, text) that ask candidates to explain their code, and an AI-assisted scoring tool in async reports with adjustable AI autonomy, so recruiters delegate as much or as little as they trust.

02 · REDUCE EFFORT - Cut the review load

I designed video transcription and AI summaries so recruiters decide without watching full recordings, plus a chatbot to compare candidates, exercises or whole campaigns in plain language.

03 · MAKE IT A TEAM SPORT - Shareable candidate profiles

I designed taggable, shareable AI analysis inside a candidate profile any colleague can open, so hiring decisions become collaborative and faster.

FEATURE IN PRODUCTION · SHIPPED TO PRODUCTION

AI-assisted grading, in the recruiter's hands

Recruiters set evaluation criteria and choose how much AI grades - here, partial. Three grading modes (no AI, partial, complete) keep the recruiter in control.

The screenshot shows the 'Evaluation criteria' setup screen in the CoderPad SCREEN application. The interface is divided into a left sidebar and a main content area.

Left Sidebar:

- SCREEN (active)
- INTERVIEW
- MAP
- Tests
- Questions
- Candidates

Main Content Area:

- Evaluation criteria (400 pts in total)**
- Automatic validation (300 pts)**
 - Criterion name 1 (100pts)
 - Criterion name 2 (100pts)
 - Criterion name 3 (100pts)
 - Form for Criterion name 3: Criterion name (100pts), Skill (Enter or select a skill), Weight (1), Points (100)
- Manual validation (100 pts)**
 - Use AI to give insights or grade your criteria.
 - Have at least 4 code lines (100pts)
 - Form for 'Have at least 4 code lines': Criterion name (Have at least 4 code lines), Skill (Javascript), Weight (1), Points (100)
 - AI grading tool: Partial grading (dropdown), Generate description button
 - Description: ex : Candidate should code at least 4 lines to validate this criterion. If 3 or less, criterion fails.

Bottom Bar:

- Upgrade button
- Back button
- Next button

The criteria-setting screen of CoderPad's AI-assisted grading feature - real UI, shipped to production.

The candidate report: AI verdict, recruiter override

The candidate report shows the AI verdict and analysis criterion by criterion, in plain language - and the recruiter can confirm or override every single one.

Only one file
Problem solving 0 pts

Tokens with square brackets ✨
Problem solving +100 pts

AI analysis :  Passed

[AI answer and grading analysis]
Ex : 2 files created but one of them is empty.

Scoring guidelines ⓘ

No tokens with square brackets in the code.

Strange directory names ✨
Problem solving 0 pts

The candidate-side report: each criterion shows a pass/fail verdict with plain-language AI reasoning underneath.

WCAG-compliant, tokenized, built for light/dark from day one

The grading UI's component library is checked for contrast against WCAG AA/AAA directly in Figma, with semantic tokens (info / success / warning / error) that carry accessible contrast through both light and dark themes - not a retrofit, but a default.

Figma component library: live WCAG contrast checking, semantic color tokens, and light/dark theming on the same Alert component.

CASE STUDY 02

Dualsun

Unblocking a solar B2B team with research and a scalable system

The challenge

Turn complex, unintuitive solar experiences into clear journeys, and modernize the design system so the whole team moves faster.

MY ROLE

Solar simulator redesign
IoT dashboard (piloted)
WCAG design system
Directed 2 freelance designers

TEAM

Product managers · Developers
QA · Engineers · Data · Marketing

TOOLS

Figma · Hotjar
VWO (A/B, MAB)

Results

+14%

conversion

−50%

research time

+20%

PM discovery

Cross-platform consistency

DUALSUN

How I did it

PAIN POINT

A confusing roof + exposure step caused drop-off in the simulator, on top of an inconsistent, non-compliant design system.

THE REAL CHALLENGE

One designer, tight budget, three platforms - impact had to come from leverage, not hours.

OUTCOME

+14% conversion, -50% research time, +20% PM discovery.

01 · RESEARCH - Redesign the core journeys

I simplified the connected-client simulator from 6 steps to 5 by folding the confusing exposure step into the roof step, and streamlined the IoT app setup so clients and installers succeed on their own.

02 · UNBLOCK - Remove the bottleneck

I wrote dev tickets, drove tech reviews and shipped reusable templates so design stopped being the blocker.

03 · LEAD & ENABLE - Direct the design effort

I directed two freelance designers to parallelize features without new hires, trained PMs to run their own interviews, and scaled a WCAG design system (Tailwind, Material/Ionic) across platforms.

Writing a tone of voice by user type, not just by brand

Alongside the visual system, I wrote the product's tone-of-voice guidelines with distinct rules per audience - professional installers need direct, jargon-light instructions; homeowners need reassurance and plain language. Every rule ships with a right/wrong example.

Tone-of-voice guidelines written for the "Installer" persona, with concrete right/wrong copy examples for the team to apply consistently.

Merging two confusing steps into one clear one

+14% conversion, validated by A/B (MAB) testing. Before: separate Roof and Exposure steps caused drop-off. After: one "Your roof" step covers orientation and incline together, with the same satellite-map context users already understood.

Left: the old two-step flow (Roof, then Exposure). Right: the new merged "Your roof" step that replaced both.

One guided path, fully responsive

The four-step journey for prospects (not logged in): project, roof, solutions, consumption - shown here on mobile, end to end. Same clarity and logic as the connected-client simulator, adapted for a smaller screen and no account required.

The image displays four sequential mobile app screens for the Dualsun prospect journey, each with a 'Connexion' button in the top right corner.

- Screen 1: Votre projet**
Title: **Votre projet**
Section: **Initiez votre projet**
Form: 'Votre installation concerne :'
Options: ☒ Une maison individuelle, ☐ Un bâtiment collectif ou commercial
Form: 'Vous êtes :'
Options: ☒ Propriétaire, ☐ Locataire
Form: 'Votre bâtiment se situe au :'
Input: 'Entrez votre adresse'
Text: 'Vous pouvez aussi rentrer ces informations manuellement [en cliquant ici](#)'
Button: **Suivant →**
- Screen 2: Votre toit**
Title: **Votre toit**
Section: **Précisez la configuration de votre pan de toiture**
Form: 'Orientation'
Text: 'Précisez l'orientation du pan de toiture le plus exposé au soleil'
Image: Map with orientation arrows (Nord, Est, Sud, Ouest)
Buttons: Est, **Sud-Est**, Sud, Sud-Ouest, Ouest
Section: **Inclinaison**
Options: ☐ Toit plat, ☐ Pente faible (5° - 30°), **☒ Pente moyenne (30° - 45°)**, ☐ Pente forte (45° et plus)
Button: **Suivant →**
- Screen 3: Nos solutions**
Title: **Nos solutions**
Section: **Sélectionnez la solution DualSun installée sur votre toiture**
Options: **Électricité photovoltaïque** (Panneaux photovoltaïques), Eau chaude sanitaire et électricité (Panneaux hybrides)
Button: **Suivant →**
- Screen 4: Votre consommation**
Title: **Votre consommation**
Section: **Renseignez votre consommation**
Form: 'Votre facture d'électricité :'
Options: ☒ Je connais la facture annuelle (hors abonnement), ☐ Je connais la consommation annuelle, ☐ Je ne les connais pas
Form: 'Facture annuelle d'électricité'
Input: 1500 € / an
Text: 'Votre consommation est estimée à 9 393 kWh (estimation calculée sur la base d'un prix moyen de 17 c€/kWh électrique)'
Button: **Calculer →**

The four mobile steps in sequence - project, roof, solutions, consumption - each reachable without creating an account.

The same clarity, across products

Two views of the IoT dashboard - daily electricity production (SHELLYbox) and yearly hot-water production (SPRINGbox) - sharing one consistent, accessible system across every Dualsun product.

Left: daily electricity view (SHELLYbox). Right: yearly hot-water production view (SPRINGbox) - same visual language, different data.

Let's build what's next.

Thank you for reading. I'd love to talk about the leverage I can create for your team.
